

The task is to create an application with two pages:

1. List of trips
2. Trip details page

The list of trips page must display available trips in following display modes: **table and a card-based grid view**. The card display mode requires the following specific layout:

Clicking on the “learn more” button should take the user to a page with the following layout:

Requirements:

- The website should be built with ReactJS functional components and Typescript
- The website should be responsive
- Radix-Primitives-based ui library should be used, ie. Radix Theme,
- Data should be downloaded asynchronously from a mock server - serving json file (any technology). The mock server should have two endpoints: one to get the list of trips and one to get the single trip details by id
- New cards in card-based grid view should be loaded on page scroll (infinite scrolling)
- List of trips page should contain filtering and sorting functionality as well option to change display mode (table and grid)
- Data from the server should be cached and preserved between pages
- The code should be placed in any repository along with instructions on how to run the project
